

MultiBuffer DS1 Factory Reset

After installing new DS-1 firmware into the chassis, it may be necessary to perform a “first Birthday” or factory reset to the unit to make it function properly.

With the power turned off...

1. Press and hold the left and right arrow buttons on the front panel.
2. While holding buttons, power the unit on and continue to hold until unit says “Full Initialization”

Unit is now reset to factory settings and should run with the new software properly.
